

Dear MEPs,

EU biofuels policy is failing

to deliver on its basic objective of cutting CO₂ emissions from Europe's transport. Instead, it exacerbates land grabs, deforestation, hunger and poverty.

- Current plans to fulfill most of the 10% renewable transport target with biofuels would have the same effect on the climate as adding up to 26 million extra cars to Europe's roads.
- The amount of land required to fill a family car with grain biofuel would provide enough food to feed a child for 200 days.

**Can it be justified to support this with
€10 billion of public resources every year?**

We urge you to vote to:

- halt the expansion of land-based biofuels in transport,
- fully account for their climate impacts, including the emissions from indirect land-use change,
- phase out public support and subsidies for environmentally damaging fuels.
